

Moving on to further developments of the study, it is highly recommended to delve into the possibility of incorporating service level risks with demand uncertainties. With growing popularity of uncertainty considerations, one of the most uncertain aspects in disaster relief operations is the level of demand when disaster strikes. This must be further reconciled and combined with the model's capability to develop optimal policies under a certain level of risk and service level trade off in order to further develop studies into disaster relief management.

BIOGRAPHY

Hazel Lynne C. Lim is currently an undergraduate student in the Department of Industrial Engineering at De La Salle University, Manila, Philippines. Her research interests include supply chains and operations research.

Steven Kristopher L. Ong is currently an undergraduate student in the Department of Industrial Engineering at De La Salle University, Manila, Philippines. His research interests include supply chains and operations research.

Martin Julian F. Ongchuan is currently an undergraduate student in the Department of Industrial Engineering at De La Salle University, Manila, Philippines. His research interests include supply chains and operations research.

Charlle L. Sy is an Associate Professor in the Department of Industrial Engineering at De La Salle University, Manila, Philippines. She earned her B.S. and M.S. in Industrial Engineering from the same university. Meanwhile, she obtained her PhD in Industrial and Systems Engineering in the National University of Singapore, Singapore. She has published in Scopus-indexed journals and conference papers and had completed research projects in the energy, service and semiconductor industries. Her research interests include optimization under uncertainty, energy networks, supply chains, and system dynamics.
